Subject: Gainful Employment Data analysis questions for ED
To: Chip Cameron <████████@██████████>

Regarding the data used for analysis to determine the debt to earnings ratio,

1. Does the data used for the draft charts on data analysis include just borrowers or does it include all Title IV students as is being proposed? It says borrowers in the charts but I want to be sure.
2. Why are approximately 250 associate degree programs showing at Community College systems?
3. The total number of programs in the dataset is greater than the covered programs that show in Power Point. Which number is correct?
4. When determining the Debt to Income ratio for programs, are you looking at the last program of study that the student was enrolled in to determine the program that is affected or is it spread out amongst all the programs the student was enrolled in during his/her tenure at the school? If allocated across programs, please explain the methodology in more detail.

Thanks.
